

Frequency in Scandiatriplant of renal transplantation after transplantation with a non renal organ

Renal dysfunction after transplantation of a prior non renal organ due to immunosuppressive drugs is a known implication.

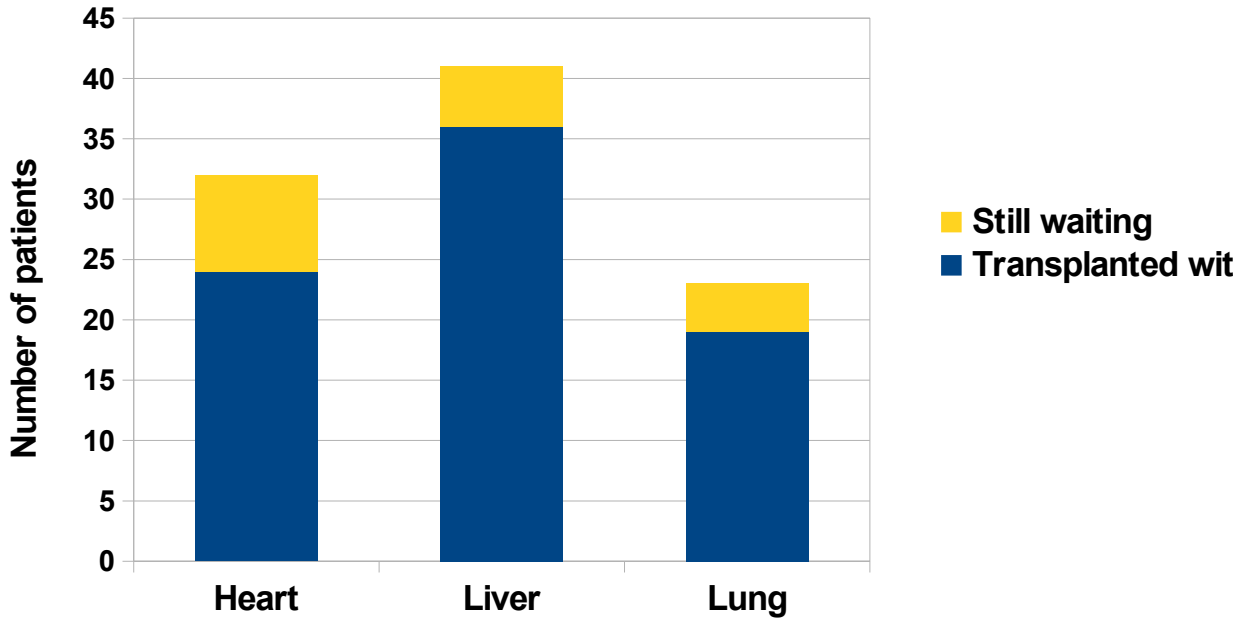

This lead to extracting data from the Scandiatriplant database to get an overview of the occurrence of prior non renal transplantation followed by renal transplantation.

The figures includes 5481 patients whom received a heart, lung, heart–lung or liver transplant in one of the Nordic countries between January 1, 1995 and October 25, 2012. The analysis excludes patients whom had had a transplantation with a kidney before the transplantation with heart, lung or liver.

The percentage of patients enlisted on the kidney waiting list after a non renal transplantation in the Nordic countries are for heart-patients 1.8%, liver-patients 1.3% and lung-patients 1.4%.

**Status for patients enlisted on kidney waiting list after prior tx. with other o
as of October 22, 2012**

Time between heart/liver/lung tx. and enlisting for kidney tx.
